

Grafi Spatial Hub

Field operators used to have to return to the office to upload their data with any amendments being a whole new site visit. Today, the Grafi Spatial Hub from MGISS with its full mapping data and reporting control, allows your network information to be uploaded, edited and analysed in real time. More efficiency, fewer errors and increased productivity ...sounds good to me too.

Step One

Collect data or edit existing data in the field on a mobile device.

Step Two

Data is then synced automatically and securely to the cloud and made available in the Grafi Spatial Hub.

If required at this stage, the data can be exported straight to a webmap.

How Does it Work?

Step Three
Data can be validated, Quality Assured and distributed back to field teams.
Data can also be exported from here for further geo-analysis.

Step Four
Automated reports can be configured via a customised dashboard and data shared via an interactive webmap with project teams and clients.
